

ABSTRACT

Techniques are disclosed for selecting alternative content views for rendering. Using these techniques, content designers specify alternative content views that are designed for use under different conditions, and a particular alternative view is programmatically selected (according to applicable conditions) when the content is to be rendered. Preferably, the alternative views are provided on a component-level basis, where the selected component view or version then forms part of a larger view (such as a Web page). Optionally, more than one component may be designed to vary simultaneously. In this case, the components may vary independently of one another.
